

# Plant for the PLANET

- Mangrove forests are one of the most productive ecosystem of the world. They provide a host of ecosystem services
- Mangroves forests are spawning grounds and home to variety of animals, insects, amphibians and fishes
- Mangroves are natural barriers and defence against severe storms, cyclones & tsunamis
- Mangrove are incredibly effective in sequestering carbon and locking it away in soil
- Mangroves serve as a critical spawning and nursery ground and therefore play an important role in the health of fisheries and the economic well-being of fishers
